

Empco-Lite Model 212-3S Solar Assist

Important Instructions:

The Model 212-3S is equipped with a high output solar panel capable of flashing the light in the off position. You must cover the solar panel in high light conditions when outdoors to make certain the light is on before using.

In the off position, with the solar panel covered, the light will not flash or flash very quickly with little intensity.

With the solar panel covered, push the internal switch with the switch pin, to turn the light on. The light will now flash brightly, even with the solar panel completely covered. This indicates that the light is on and ready to be used on the jobsite.
